A Measurement of Excess Antenna Temperature at 4080 Mc/s

A.A. Penzias & R.W. Wilson

Measurements of the effective zenith noise temperature of the 20-foot horn-reflector antenna (Crawford, Hogg, and Hunt 1961) at the Crawford Hill Laboratory, Holmdel, New Jersey, at 4080 Mc/s have yielded a value of about 3.5 K higher than expected. This excess temperature is, within the limits of our observations, isotropic, **unpolarized**, and free from seasonal variations (July, 1964 - April, 1965). A possible explanation for the observed excess noise temperature is the one given by Dicke, Peebles, Roll, and Wilkinson (1965) in a companion letter in this issue.

WMAP Information

Wilkinson Microwave Anisotropy Probe

Technology : HEMT

Platform : Satellite

Frequencies : 23, 33, 41, 61, 94 GHz

The probe consists of two back-to-back Gregorian

NET/Detector : 0.8, 0.8, 1.0, 1.2, 1.6 mK_{ATM}

Location : 2nd Sun-Earth Lagrange point

of Detectors : 4, 4, 8, 16

Start Date : June 2001

Beam Size : 35, 30, 31, 21, 13

Duration : 4 years (?)

Members :

Sky Fraction : 1.0 (Full Sky)

PI(s) : Charles Bennett (GSFC)

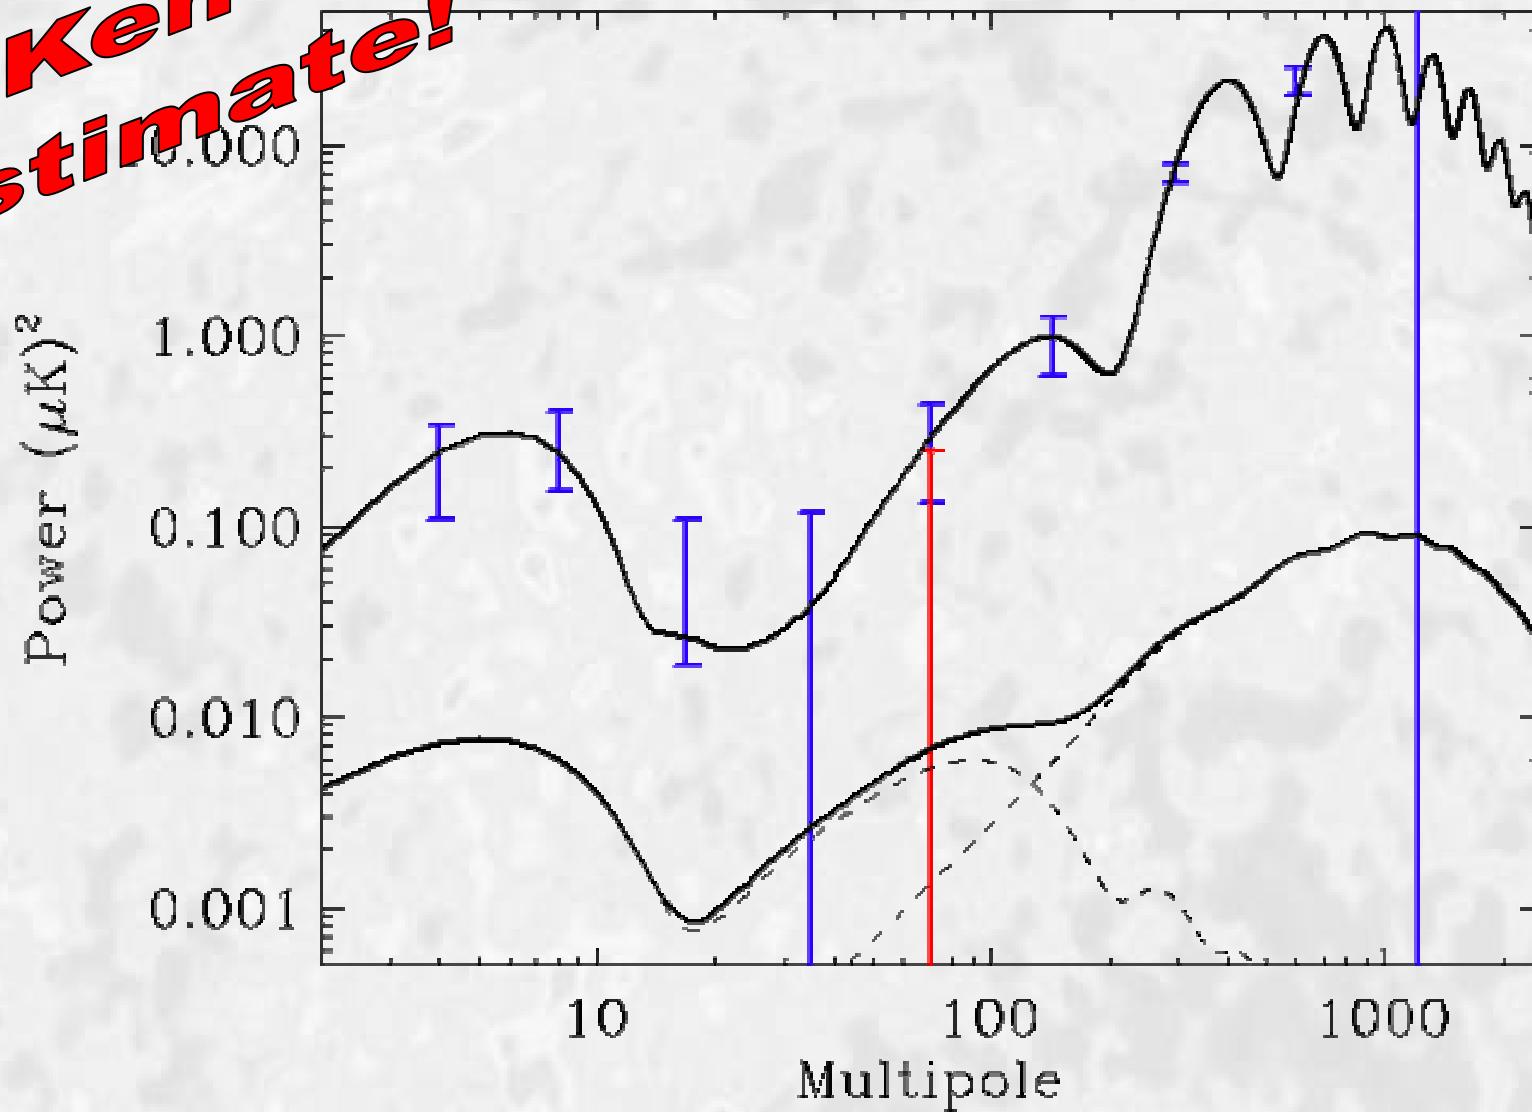

Efficiency : 100%

Quick QUaD Facts

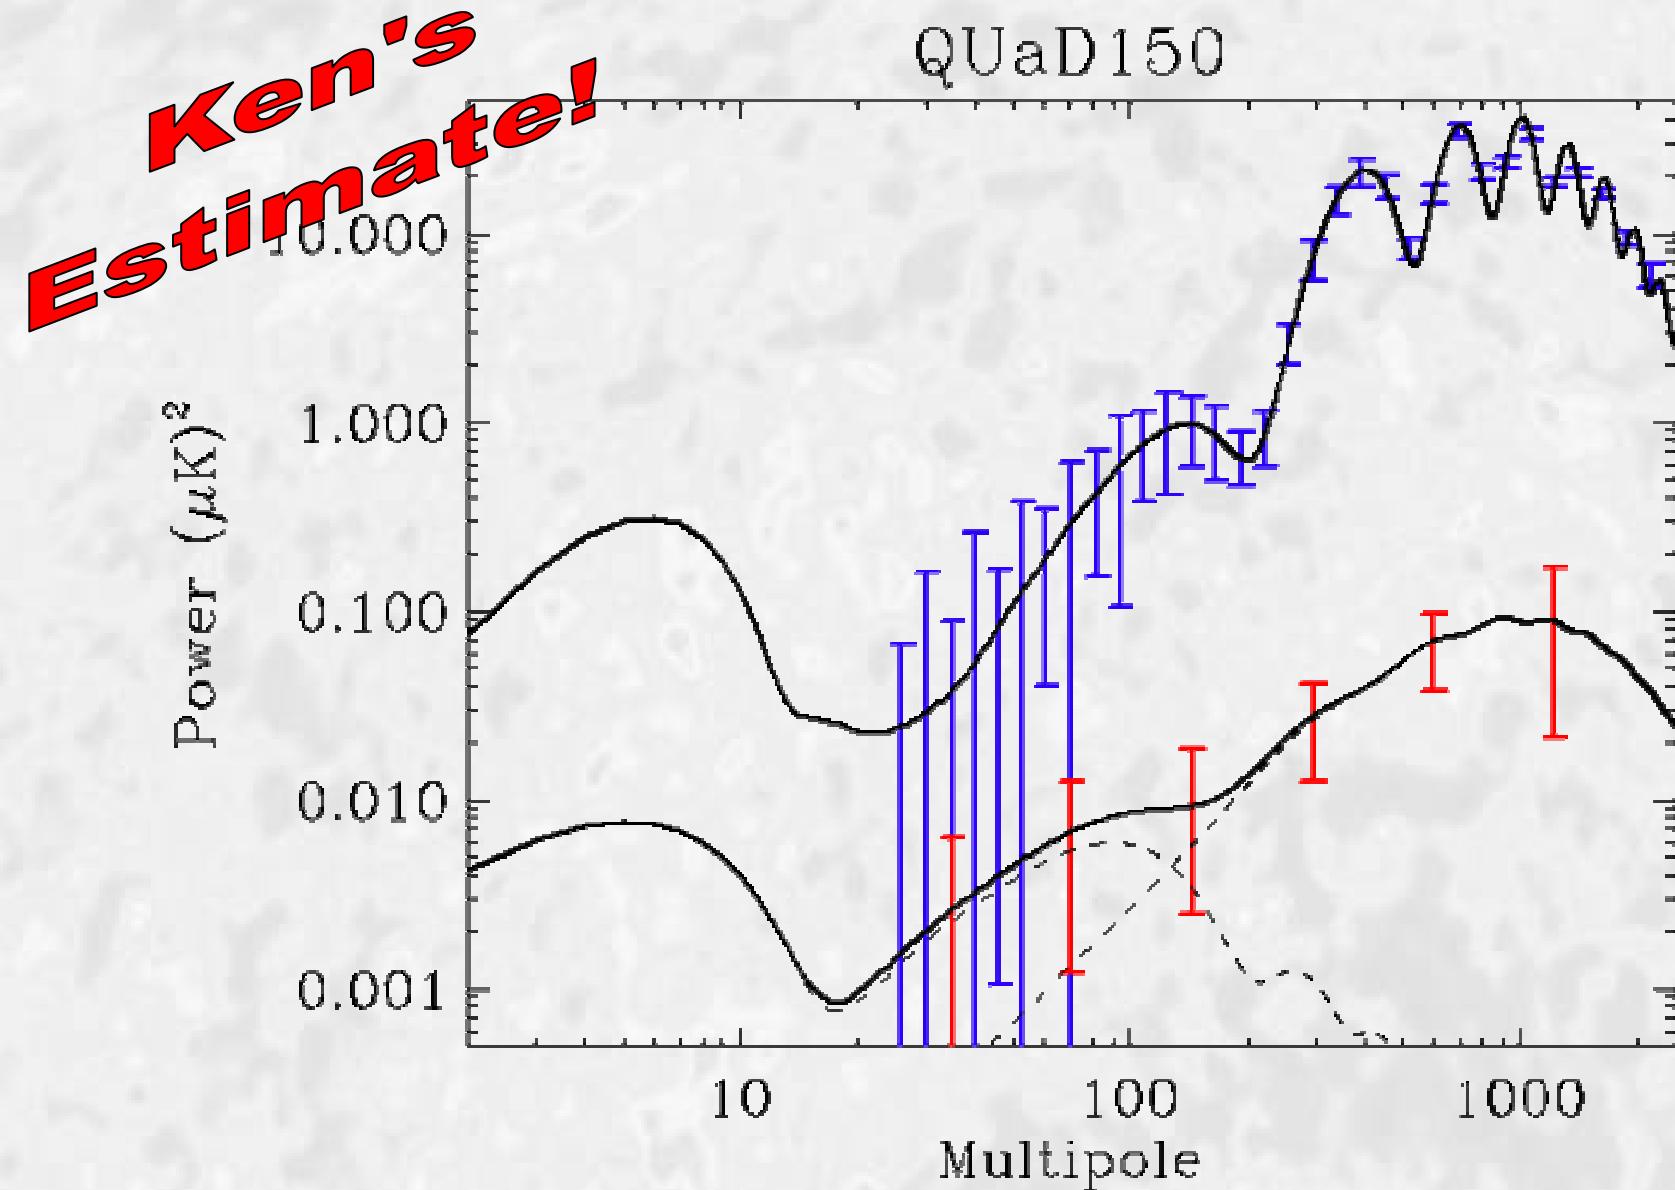

- Designed specifically for polarization measurements
 - 100 and 150 GHz
 - Angular resolution of 4-6'
 - 300 square degrees of sky
 - Bolometric array receiver mounted on a 2.6 m telescope
- Comprises the QUEST experiment mounted on the DASI platform at the South Pole (QUEST at DASI – QUaD)
- Extremely stable environment with very low water vapor emission – ideally suited for CMB astronomy

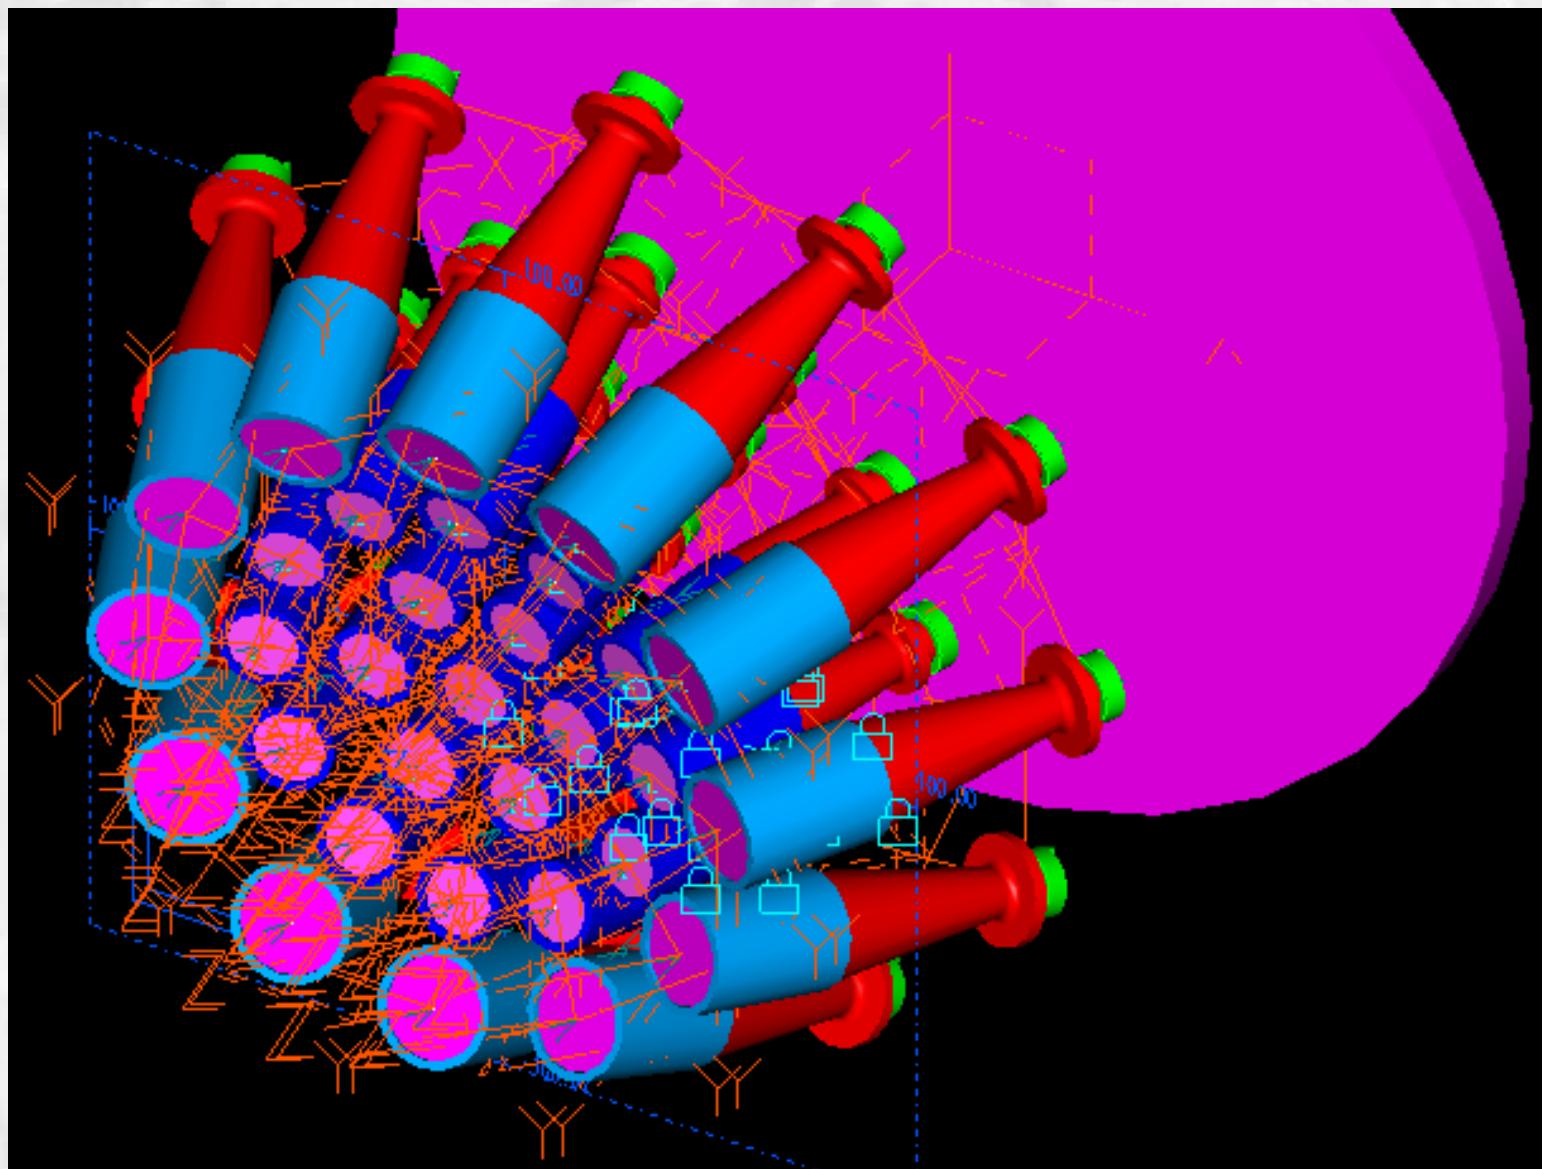

Secondary supported with foam cone to reduce stray reflections

Freq (GHz)	Beam (')	# Feeds	% Bandwidth	NET/bolo. ($\mu\text{K}\cdot\text{s}^{1/2}$)
100	6.3	12	25	270
150	4.2	19	25	300

QUaD Focal Plane

BICEP Information

Technology : Pol. Sens. Bolometers

Platform : Ground Based

Frequencies : 100, 150 GHz

Telescope :

NET/Det. : $280, 280 \mu\text{K}_{\text{CMB}} \text{s}^{1/2}$

Location : South Pole

of Det. : 48, 48

Start Date : February, 2005

Beam Size ('') : 60, 40

Duration : 2 austral winters

Multipoles :

Sky Fraction : 0.08

PI(s) : Andrew Lange (Caltech)

Reference :

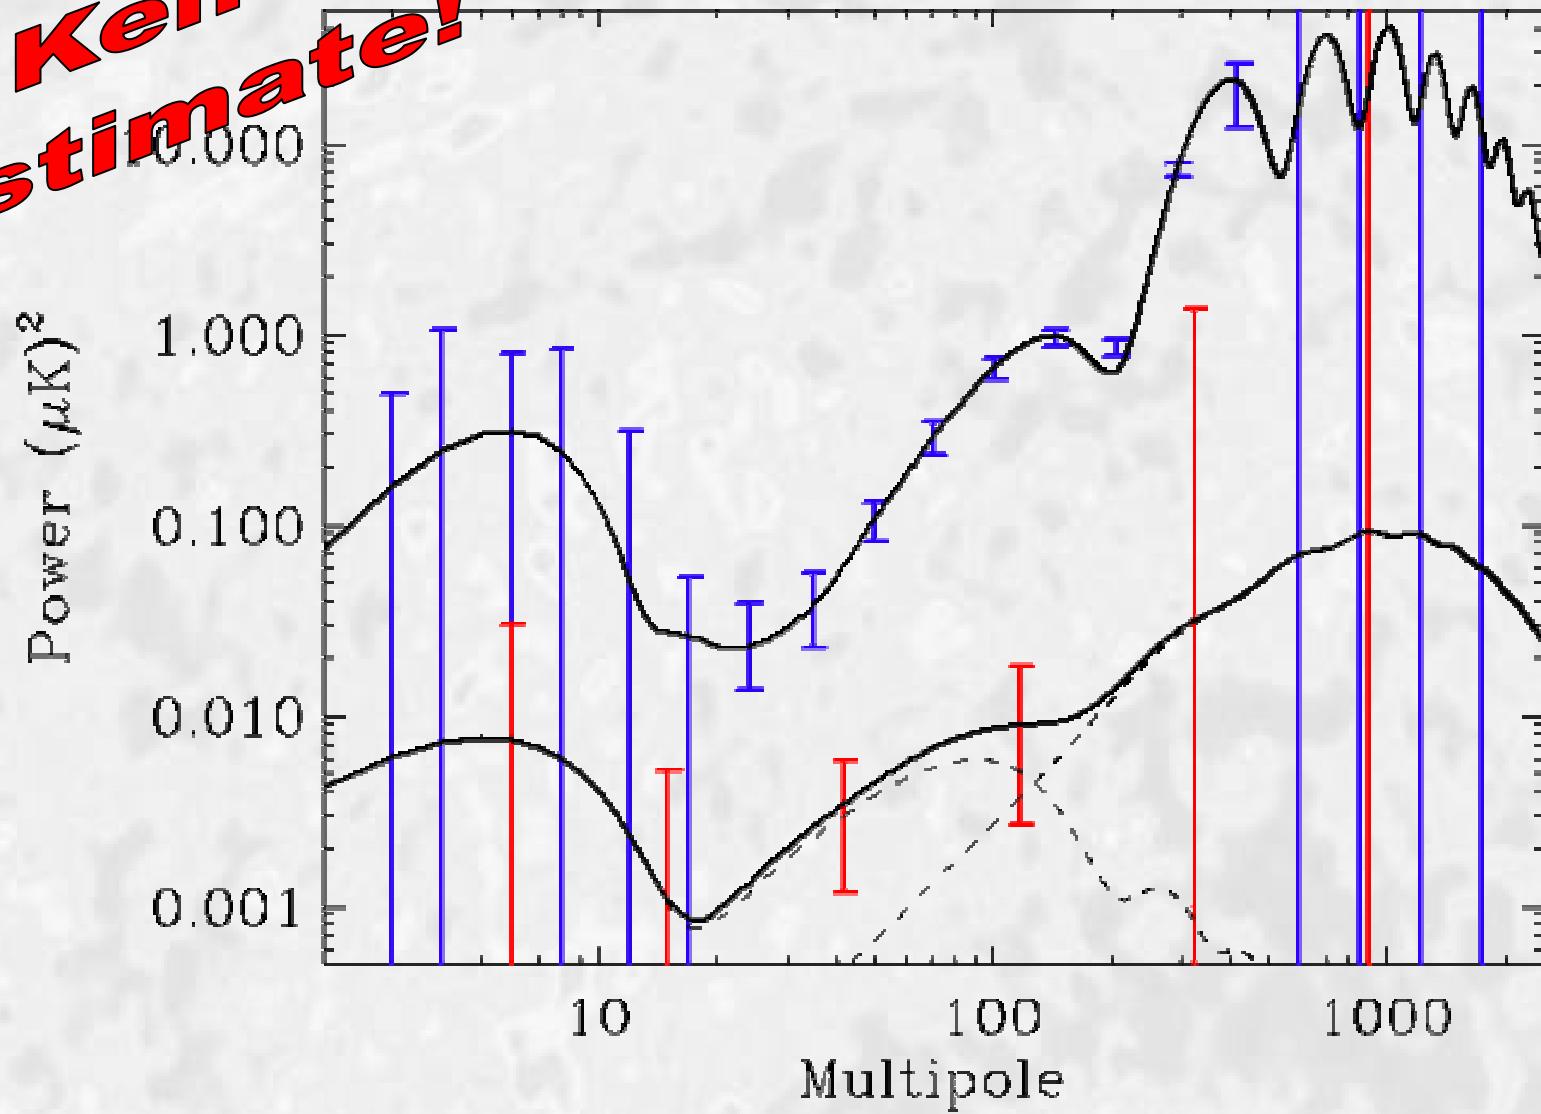

Web Page :

- South Pole site allows for a continuous observation of a contiguous region on the sky – ideal for measuring B-modes
- The BICEP mount will have the capability to tilt from vertical as well as continuous rotation about the dewar boresight at ~1 RPM
- Drift scanning will be combined with continuous boresight rotation for a well-connected and modulated map
- Drift-scanning and boresight rotation are combined with frequent calibrations, faraday modulation, and PSB pair differencing to achieve five levels of differencing

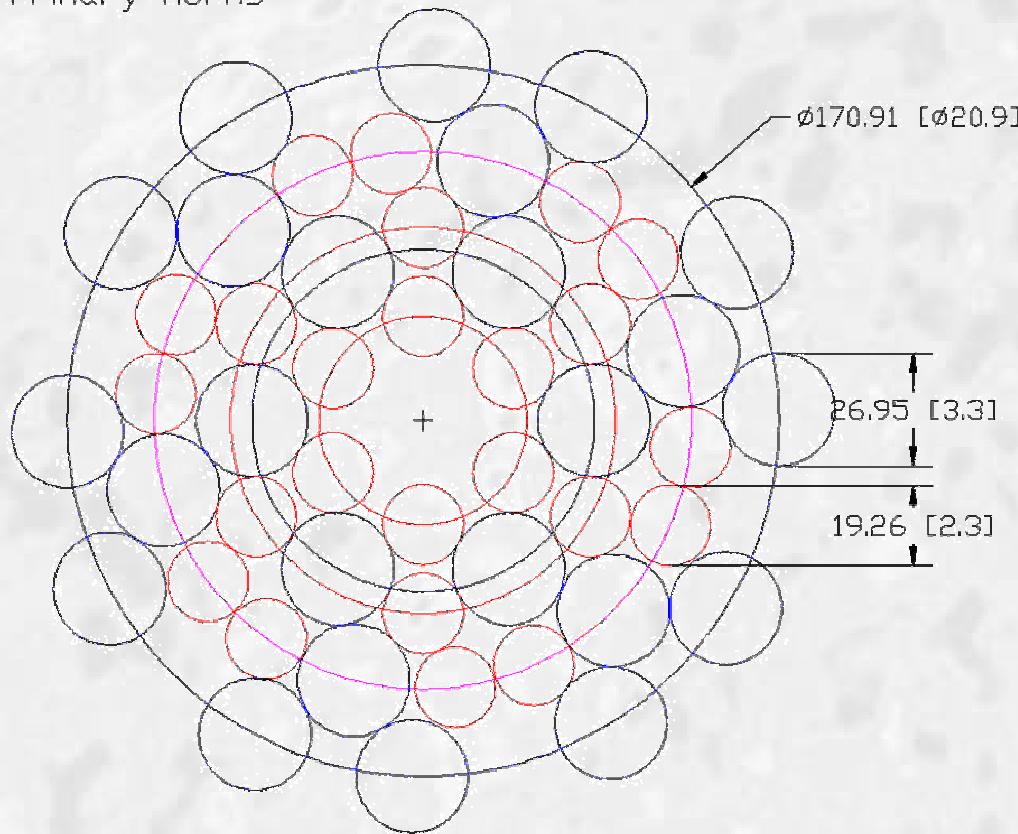

BICEP150

*Ken's
Estimate!*

BICEP Focal Plane

Primary Horns

- 24 horns / 48 detectors at each frequency
- Pixels arranged in circular rings to take advantage of boresight rotation

- We will have mapped features in the E-E spectrum
- We should have a detection of B-B lensing spectrum, IGWs if nature is forthcoming...
- A number of initial version of the experiments discussed later will also be coming out with results similar to those discussed previously, if funded...
- Planck should be flying...

-
- We will have begun to reconstruct the B-B spectrum with high quality maps of the polarized microwave sky of area \sim 300 square degrees (i.e., less than a percent of the sky) and perhaps 10%.
 - All of the previous are also sold as preparatory experiments for the “next” satellite mission (post-Planck), CMBPol...

**Alan Kogut / Goddard Space Flight Center
Primordial Anisotropy Polarization Pathfinder Array (PAPPA)**

Astronomy and Physics Research and Analysis Proposal

We propose to fly the Primordial Anisotropy Polarization Pathfinder Array (PAPPA) to measure the polarization of the cosmic microwave background (CMB), characterize polarized Galactic foregrounds, and search for the imprint of gravity waves produced during an inflationary epoch in the early universe. It will characterize the E-mode polarization on angular scales comparable to the horizon at decoupling, and search for the gravity wave background produced during inflation. Measurement of the power spectrum of the dominant E-mode polarization improves understanding of fundamental cosmological parameters by breaking parameter degeneracies inherent when fitting temperature data alone. Detection of a fainter B-mode signal would have profound consequences for cosmology and high-energy physics. The amplitude of the B-mode polarization is a direct measure of the energy scale of inflation. Its detection would thus not only provide a ``smoking gun'' demonstration of inflation, but the determination of the relevant energy scale would shed light on physics at energies forever inaccessible to direct experimentation in particle accelerators. PAPPA addresses national priorities outlined in recent reports by the National Academy of Sciences and further detailed in the Beyond Einstein roadmap for NASA's Structure and Evolution of the Universe theme. PAPPA will develop critical technologies for the Beyond Einstein inflation probe and validate their performance in a flight environment. PAPPA is designed to minimize systematic error, and incorporates multiple features likely to be part of an eventual space mission. It consists of 32 independent "polarimeters-on-a-chip", each fabricated using photolithographic techniques with no macroscopic components other than the beam-forming optics. The polarimeters are solid state, low power, and fully scalable to large format arrays.

Long Term

NASA's Inflation Probe Studies

- Imaging Cosmic Microwave Background Polarization with EPIC
 - Bock, James (NASA Jet Propulsion Laboratory)
- A Mission Concept Study for the Einstein Inflation Probe
 - Hinshaw, Gary (NASA/GSFC)
- Mission Concept Study for the Einstein Polarization Interferometer for Cosmology (EPIC)
 - Timbie, Peter (University of Wisconsin-Madison)
- The possibility of a European Inflation Probe is being discussed as well.
