

# The close (0.02-2.5 AU) giant planet population around Main-Sequence AF stars

S. Borgniet, A.-M. Lagrange, N. Meunier  
Institut de Planétologie et d'Astrophysique de Grenoble

# (Close) GP occurrence rate vs stellar mass

Core-accretion model:

More GPs around higher-mass stars

GPs form at larger separations around higher-mass stars

GP occurrence rate vs stellar mass  
predicted by CA model

Kennedy & Kenyon, 2008

# Precise RV computation for early-type stars

AF stars: usually not suited for RV studies (fewer lines, rotational broadening)

**SAFIR** method for AF stars: cross-correlation with reference spectrum

(median of all spectra) instead of with classical binary mask

Get RV, CCF, BIS

Galland et al. 2005a, 2005b, 2006

Galland et al., 2005

# Sample

Two RV Large surveys (2005-2013)

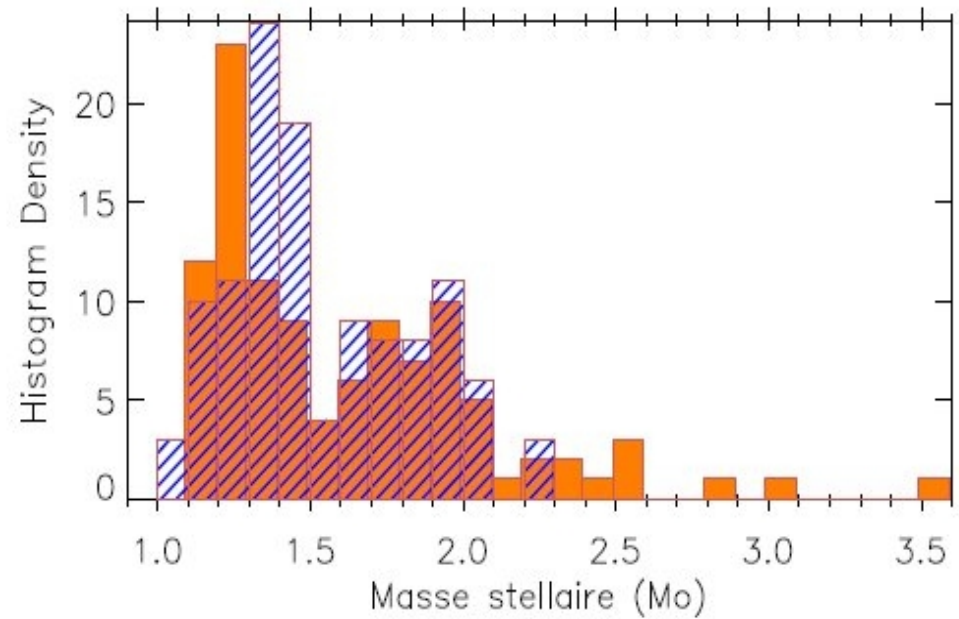

North: **OHP/SOPHIE** (115 targets)  
South: **La Silla/HARPS** (108 targets)

# Sample

Early-type stars  
Faster-rotators

Stellar mass range  
 $\sim 1.1-2.5 M_{\odot}$

# Stellar intrinsic variability

$\langle \text{RV uncertainty} \rangle$  (m/s)

A-F sample

RV rms (dispersion) (m/s)

# GP detections

Borgniet et al., 2014

**Example:** at least one GP detected w. SOPHIE around HD 113337 (F5V,  $M \sim 1.4 M_{\odot}$ )

$P \sim 325$  days,  $m \sin i \sim 2.85 M_{\text{Jup}}$ ,  $e \sim 0.46$

# GP detections (Harps sample)

Harps sample (only)

4 GPs detected in all

14 spectroscopic binaries  
(SB1 mainly)

Borgniet et al., 2015  
(to be subm.)

$P=820$  days,  $m \psi \sin i = 4.51$  Mjup  
(F5-6V star,  $M \sim 1.2$  Mo)

# Detection limits

Computed with LPA (periodogram analysis) method  
(Meunier et al., 2012; Lagrange et al., 2013)  
Period range: 1-1000 days ( $\sim 0.02$  -  $\sim 2$ . AU)

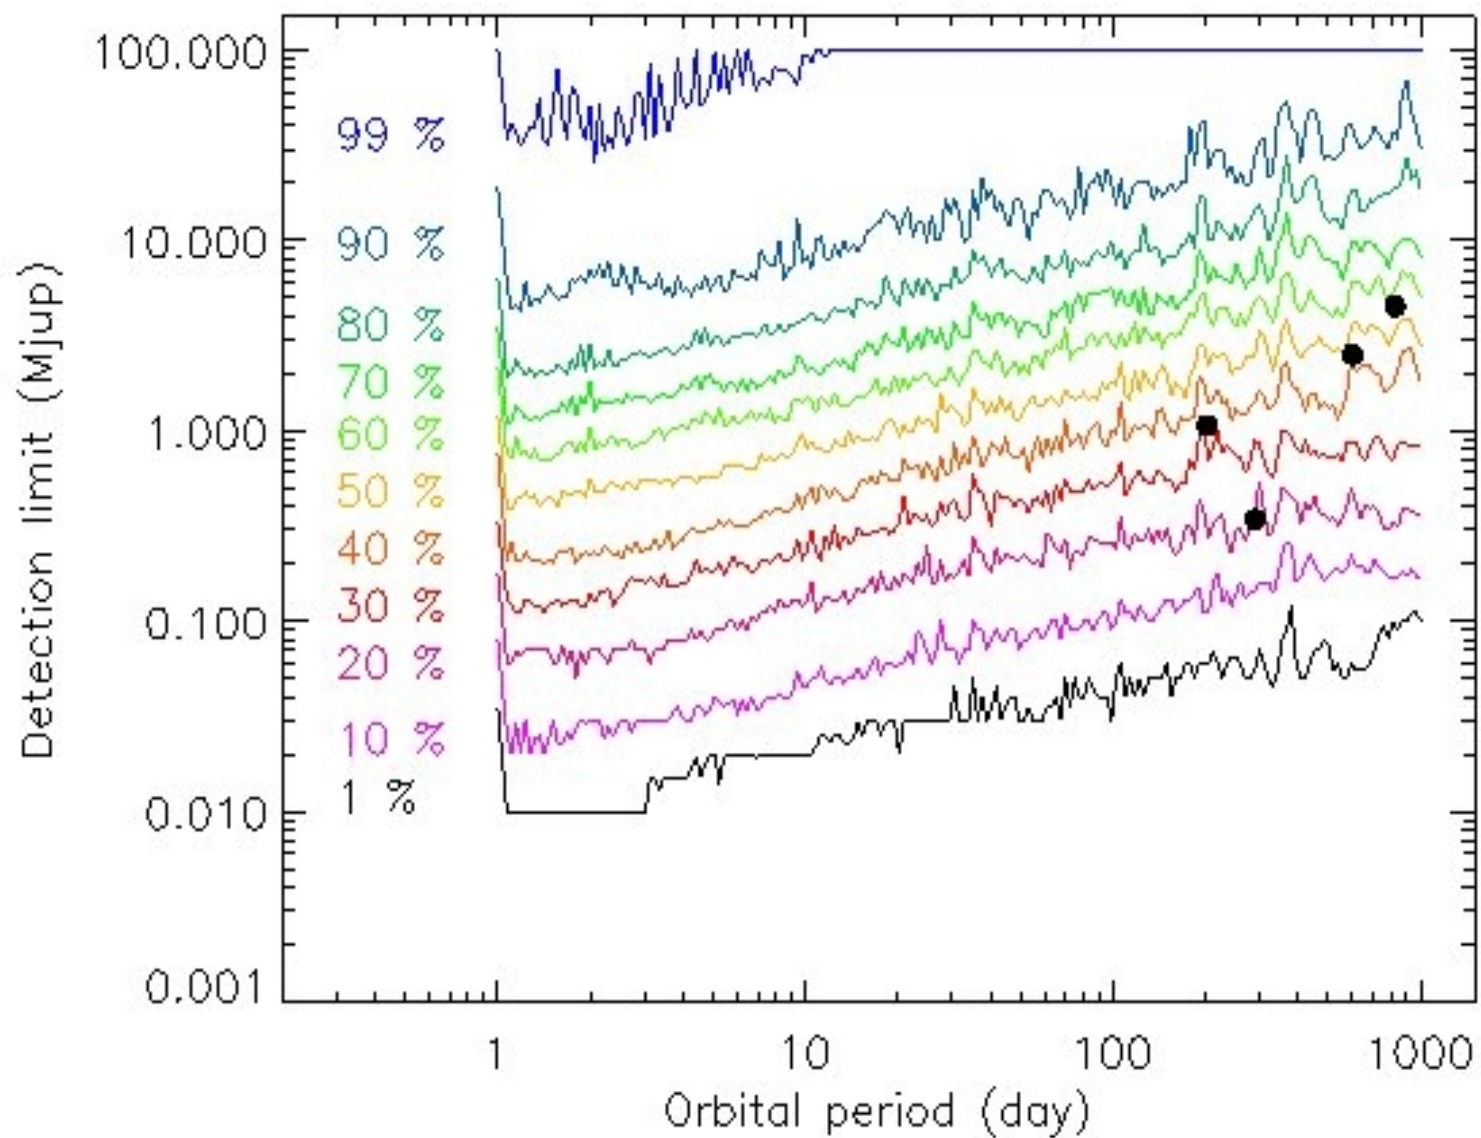

A3V, vsini= 115 km/s

F6V, vsini= 5 km/s

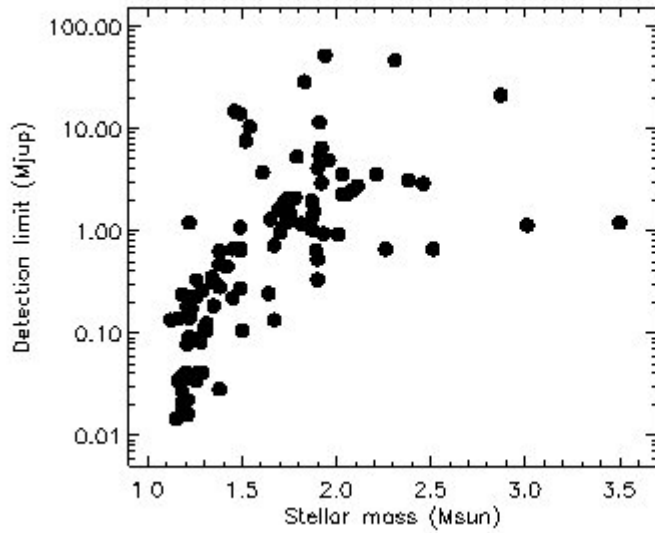

# Search completeness (Harps sample)

# Detection limits vs stellar mass

P=10 days

P=100 days

P=1000 days

Two subsamples  
 $M < 1.5 M_{\odot}$  and  $M > 1.5 M_{\odot}$

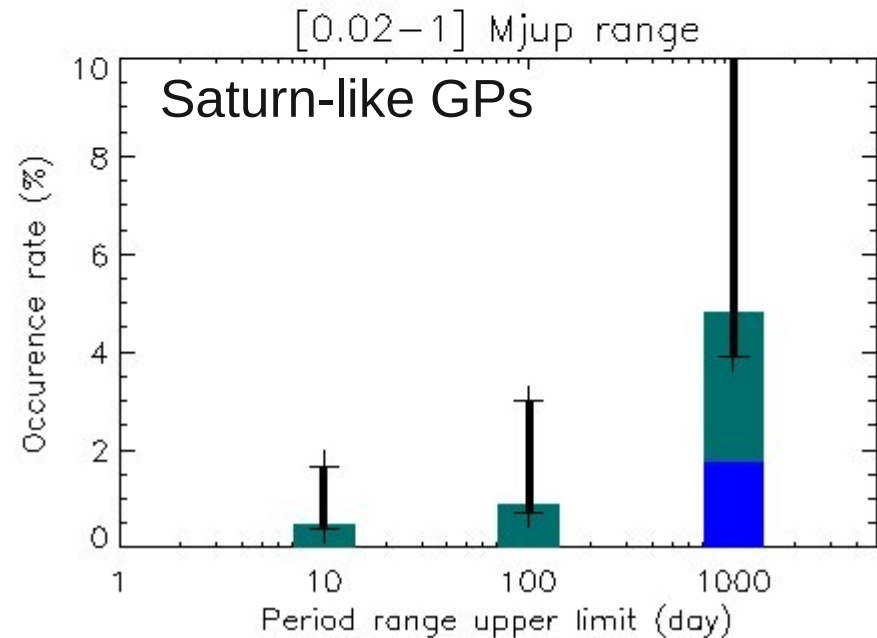

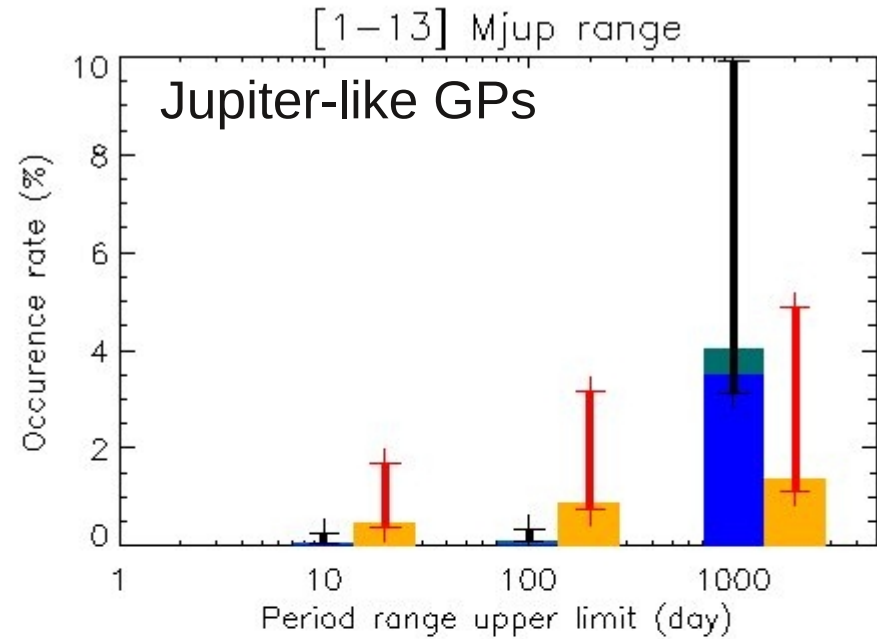

# Constraints on close GP occurrence rate vs stellar mass

1-13 Mjup GP rate vs stellar mass  
(full period range):

$M < 1.5 M_{\odot}$ :  $4^{+5}_{-1}$  %

$M > 1.5 M_{\odot}$ :  $< 2^{+2}_{-1}$  %

Borgniet et al., 2015  
(to be subm.)

# Conclusion and perspectives

Constrains on lack of GPs very close to the star ( $<0.5$  AU)

In agreement w. RV observations of subgiant stars (lack of HJs compared to FGK stars)

Connection with CA model predictions: inward migration phenomenon weakened for higher-mass stars ?

Complete with Sophie survey data
