primordial non-Gaussianity

Once we care about $O(1)\Phi^2$, we need to take into account: Early-time effects:

Non-linearity of General relativity (GR);

Inhomogeneous recombination;

Late-time effects:

Non-linearity of GR;

Inhomogeneous reionization;

Secondary effects lensing, SZ.

For a realistic experiment, many other things to worry about: foreground, detector-induced systematics ...

Linear-order perturbations

$$\frac{d\delta X_i}{d\eta} + A_{ij}(\eta)\delta X_i = 0$$

 δX_i (i = 1, 2, ...) are linear-order perturbations and $A_{ij}(\eta)$ are known background functions.

Perturbations include: baryon (density & velocity), CDM (density & velocity), neutrinos (phase-space distribution), radiation (phase-space distribution), and also DE if not a cosmological constant.

codes: CMBfast, CAMB, CMBEasy, CLASS, CosmoLib, CMBquick, ...

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 の久で

Second-order perturbations

$$\frac{d\delta X_i^{(2)}}{d\eta} + A_{ij}(\eta)\delta X_j^{(2)} = S_i$$

 $\delta X_i^{(2)}$ (i = 1, 2, ...) are second-order perturbations (in Fourier space), $A_{ij}(\eta)$ remain the same, and the sources S_i are convolutions of linear order perturbations.

Fortran code CosmoLib^{2nd}

Comparison with CMBQuick2 by Cyril Pitrou

- Written in Fortran, no license constraint.
- ► Faster and parallelized.
- Much more accurate (energy and momentum constraint $\sim 10^{-6}$).
- Consistent treatment of perturbed RECFast (including Helium)
- Better scheme to integrate the CMB bispectrum (truncation error reduced by a nonlinear transformation).
- Full-sky bispectrum.

CMB bispectrum

Zhiqi Huang IPhT, CEA/Saclay Collaborator: Filippo Vernizzi Second-order Boltzmann Code and CMB bispectrum

- 4 回 2 - 4 回 2 - 4 回 2 - 4

The bispectrum: definition

$$\begin{split} \frac{\Delta T}{T}(\mathbf{n}) &= \sum_{l,m} a_{lm} Y_{lm}(\mathbf{n}) \,. \\ \langle a_{l_1 m_1} a_{l_2 m_2} a_{l_3 m_3} \rangle &= B_{l_1 l_2 l_3} \begin{pmatrix} l_1 & l_2 & l_3 \\ m_1 & m_2 & m_3 \end{pmatrix} \,. \\ B_{l_1 l_2 l_3} &= b_{l_1 l_2 l_3} \sqrt{\frac{(2l_1 + 1)(2l_2 + 1)(2l_3 + 1)}{4\pi}} \begin{pmatrix} l_1 & l_2 & l_3 \\ 0 & 0 & 0 \end{pmatrix} \end{split}$$

Primordial non-Gaussianity: a difficult integral

Primordial bispectrum \Rightarrow CMB angular bispectrum

Solution: Reduce the 4D integral into products of 1D integrals by factorizing the primordial bispectrum $B_{\text{prim}}(k_1, k_2, k_3) = \sum_i X_i(k_1) Y_i(k_2) Z_i(k_3).$

See e.g. Fergusson et al. 09.

・ 同 ト ・ ヨ ト ・ ヨ ト

Second-order perturbs: a more difficult integral

$$b_{l_1l_2l_3} \propto \sum_{m_3} \int dk_1 dk_2 d\mu d\eta S_{l'_3m_3}(k_1, k_2, \mu, \eta) j_{l_3}^{l'_3m_3}[k(\eta_0 - \eta)] \sum_{m_1m_2} Y^*_{l_1m_1} Y^*_{l_2m_2} \begin{pmatrix} l_1 & l_2 & l_3 \\ m_1 & m_2 & m_3 \end{pmatrix} \dots + \text{perms}.$$

- The factorization method is not necessarily a winner (need to factorize at each time step).
- Evaluation of billions of spherical harmonics and a lot of 3-j symbols.
- Evaluation of $j_{l_3}^{(l'_3m_3)}$ with large l'_3 is numerically expensive.
- ► Too many lensing source terms (need to compute source up to l'₃ ~ l₃.)

However, if we only care about early-time effects...

- ► Source terms with large I'₃ can be ignored (this is only true with a proper choice of variables, see our paper arXiv:1212.3573).
- The geometrical factors (Y_{Im} and 3-j symbols) can be precomputed and saved.
- Only needs $j_{l_3}^{(l'_3m_3)}$ with small l'_3 .

Checking against the squeezed-limit theoretical formula

$$b_{I_{S}I_{L}I_{L}} = 2C_{I_{L}}^{TT}C_{I_{S}}^{TT} - C_{I_{L}}^{T\zeta}C_{I_{S}}^{TT} \frac{d\ln\left[\left(I_{S} + \frac{1}{2}\right)^{2}C_{I_{S}}^{TT}\right]}{d\ln\left(I_{S} + \frac{1}{2}\right)}, I_{L} \ll I_{S} \text{ and } I_{L} \ll 60$$

Zhiqi Huang IPhT, CEA/Saclay Collaborator: Filippo Vernizzi Second-order Boltzmann Code and CMB bispectrum :

Physical meaning of the source terms are well understood.

In the line-of-sight-integral approach, late-time effects can be explicitly split out.

With late-time effects removed and in the squeezed-limit, the line-of-sight source can be explicitly written as product of first-order perturbations,

$$S^{(2)}(k_1, k_2, k_3) = -\zeta^{(1)}(k_1) \frac{\partial S^{(1)}(k_2)}{\partial \ln k_2}.$$

Using properties of $j_l^{(l'm)}$ we can explicitly reproduce the squeezed-limit formula of $b_{l_1 l_2 l_3}$ using the line-of-sight-integral method. (Huang & Vernizzi in preparation).

The contamination to $f_{\rm NL}^{\rm local}$ measurement

For an ideal experiment, if we measure $f_{\rm NL}^{\rm local}$ without removing this effect, $f_{\rm NL}^{\rm local}$ will be biased by 0.82 (for $\ell_{\rm max} = 2000$) or 1.27 (for $\ell_{\rm max} = 2500$)

Though the contamination is small, it is important to remove it in order to get an unbiased result.

- 4 周 ト 4 日 ト 4 日 ト - 日

Can we see the early-time effects in the data?

For $\ell_{max} = 2000$: S/N = 0.47. For $\ell_{max} = 2500$: S/N = 0.71.

Not likely to see it without including the polarization...

伺下 イヨト イヨト

Conclusion

We did a very complicated calculation and we found nothing important \ldots

Zhiqi Huang IPhT, CEA/Saclay Collaborator: Filippo Vernizzi Second-order Boltzmann Code and CMB bispectrum

回 と く ヨ と く ヨ と

Conclusions and Outlook

- 1. We found that the contamination of $f_{\rm NL}^{\rm local}$ due to non-linear recombination is \approx 1, which can be removed using our template.
- 2. For future polarization experiments, the contamination can be important. (TO BE DONE)
- 3. Late-time effects need to be included, but likely need a new method for the bispectrum integration. (have some clue but still working on that...)
